## CONTENTS

<b>1</b>	<b>Indices and tables</b>	<b>7</b>
	<b>Python Module Index</b>	<b>9</b>
	<b>Index</b>	<b>11</b>

Contents:

**class** `matk.matk` (*\*\*kwargs*)

Class for Model Analysis ToolKit (MATK) module

**J** (*h=0.001*)

Calculate Jacobian matrix

**Jac** (*h=0.001, ncpus=1, templatedir=None, workdir\_base=None, save=True, reuse\_dirs=False*)

Numerical Jacobian calculation

**Parameters** *h* (*fl64 or ndarray(fl64)*) – Parameter increment, single value or array with *npar* values

**Returns** *ndarray(fl64)* – Jacobian matrix

**add\_obs** (*name, \*\*kwargs*)

Add observation to problem

**Parameters**

- **name** (*str*) – Name of observation
- **kwargs** – keyword arguments passed to observation class

**add\_par** (*name, \*\*kwargs*)

Add parameter to problem

**Parameters**

- **name** (*str*) – Name of parameter
- **kwargs** – keyword arguments passed to parameter class

**add\_sampleset** (*name, samples, responses=None, indices=None, index\_start=1*)

Add sample set to problem

**Parameters**

- **name** (*str*) – Name of sample set
- **samples** (*list(fl64), ndarray(fl64)*) – Matrix of parameter samples with *npar* columns in order of `matk.pars.keys()`
- **responses** (*list(fl64), ndarray(fl64)*) – Matrix of associated responses with *nobs* columns in order `matk.obs.keys()` if observation exists (existence of observations is not required)
- **indices** (*list(int), ndarray(int)*) – Sample indices to use when creating working directories and output files

**calibrate** (*workdir=None, reuse\_dirs=False, report\_fit=True, solver='lmfit'*)

Calibrate MATK model

**Parameters**

- **workdir** (*str*) – Name of directory where model will be run. It will be created if it does not exist
- **reuse\_dirs** (*bool*) – If True and *workdir* exists, the model will reuse the directory
- **report\_fit** (*bool*) – If True, parameter statistics and correlations are printed to the screen

**Returns** *lmfit* minimizer object

**forward** (*par=dict=None, workdir=None, reuse\_dirs=False*)

Run MATK model using current values

### Parameters

- **pardict** (*dict*) – Dictionary of parameter values keyed by parameter names
- **workdir** (*str*) – Name of directory where model will be run. It will be created if it does not exist
- **reuse\_dirs** (*bool*) – If True and workdir exists, the model will reuse the directory

**Returns** int – 0: Successful run, 1: workdir exists

**make\_workdir** (*workdir=None, reuse\_dirs=False*)

Create a working directory

### Parameters

- **workdir** (*str*) – Name of directory where model will be run. It will be created if it does not exist
- **reuse\_dirs** (*bool*) – If True and workdir exists, the model will reuse the directory

**Returns** int – 0: Successful run, 1: workdir exists

**model** None

Python function that runs model

**model\_args** None

Tuple of extra arguments to MATK model expected to come after parameter dictionary

**model\_kwargs** None

Dictionary of extra keyword arguments to MATK model expected to come after parameter dictionary and model\_args

**n\_cpus** None

Set number of cpus to use for concurrent model evaluations

**obs\_names** None

Get observation names

**obs\_values** None

Observation values

**obs\_weights** None

Get observation names

**par\_dist\_pars** None

Get parameters needed by parameter distributions

**par\_dists** None

Get parameter probabilistic distributions

**par\_maxs** None

Get parameter lower bounds

**par\_mins** None

Get parameter lower bounds

**par\_names** None

Get parameter names

**par\_nvals** None

Get parameter nvals (number of values for parameter studies)

**par\_values** None

Parameter values

**parameters\_file** None

Set the name of the parameters\_file for parallel runs

**residuals** None

Get least squares values

**results\_file** None

Set the name of the results\_file for parallel runs

**run\_samples** (*name=None, ncpus=1, templatedir=None, workdir\_base=None, save=True, reuse\_dirs=False*)

Run model using values in samples for parameter values If samples are not specified, LHS samples are produced

**Parameters**

- **name** – Name of MATK sample set object
- **ncpus** (*int*) – number of cpus to use to run models concurrently
- **templatedir** (*str*) – Name of folder including files needed to run model (e.g. template files, instruction files, executables, etc.)
- **workdir\_base** (*str*) – Base name for model run folders, run index is appended to workdir\_base
- **save** (*bool*) – If True, model files and folders will not be deleted during parallel model execution
- **reuse\_dirs** (*bool*) – Will use existing directories if True, will return an error if False and directory exists

**Returns** tuple(ndarray(fl64), ndarray(fl64)) - (Matrix of responses from sampled model runs siz rows by npar columns, Parameter samples, same as input samples if provided)

**save\_sampleset** (*outfile, sampleset*)

Save sampleset to file

**Parameters**

- **outfile** (*str*) – Name of file where sampleset will be written
- **sampleset** (*str*) – Sampleset name

**seed** None

Set the seed for random sampling

**set\_lhs\_samples** (*name, siz=None, noCorrRestr=False, corrmatrix=None, seed=None, index\_start=1*)

Draw lhs samples of parameter values from scipy.stats module distribution

**Parameters**

- **name** (*str*) – Name of sample set to be created
- **siz** (*int*) – Number of samples to generate, ignored if samples are provided
- **noCorrRestr** (*bool*) – If True, correlation structure is not enforced on sample, use if siz is less than number of parameters
- **corrmatrix** (*matrix*) – Correlation matrix
- **seed** (*int*) – Random seed to allow replication of samples
- **index\_start** – Starting value for sample indices

**Type** int

**Returns** matrix – Parameter samples

**set\_parstudy\_samples** (*name*, \**args*, \*\**kwargs*)

Generate parameter study samples

**Parameters**

- **name** (*str*) – Name of sample set to be created
- **outfile** (*str*) – Name of file where samples will be written. If outfile=None, no file is written.
- **args** (*tuple(fl64)*, *list(fl64)*, or *ndarray(fl64)*) – Number of values for each parameter. The order is expected to match order of matk.pars.keys()
- **kwargs** (*dict(fl64)*) – keyword arguments where keyword is the parameter name and argument is the number of desired values

**Returns** ndarray(fl64) – Array of samples

**sim\_values** None

Simulated values :returns: lst(fl64) – simulated values in order of matk.obs.keys()

**templatedir** None

Set the name of the templatedir for parallel runs

**workdir** None

Set the base name for parallel working directories

**workdir\_base** None

Set the base name for parallel working directories

**workdir\_index** None

Set the working directory index for parallel runs

**class** matk.**Parameter** (*name*, \*\**kwargs*)

MATK parameter class

**calib\_value** None

set up Minuit-style internal/external parameter transformation of min/max bounds.

returns internal value for parameter from self.value (which holds the external, user-expected value). This internal values should actually be used in a fit...

As a side-effect, this also defines the self.from\_internal method used to re-calculate self.value from the internal value, applying the inverse Minuit-style transformation. This method should be called prior to passing a Parameter to the user-defined objective function.

This code borrows heavily from lmfit, which borrows heavily from JJ Helmus' leastsqbound.py

**dist** None

Probabilistic distribution of parameter belonging to scipy.stats module

**dist\_pars** None

Distribution parameters required by self.dist (e.g. if dist == uniform, dist\_pars = (min,max-min))

**expr** None

Mathematical expression to use to evaluate value

**max** None

Parameter upper bound

**mean** None

Parameter mean

**min** None

Parameter lower bound

**name** None

Parameter name

**nvals** None

Number of values the paramter will take for parameter studies

**offset** None

Offset to add to parameter

**scale** None

Scale factor to multiply parameter by

**std** None

Parameter st. dev.

**value** None

Parameter value

**vary** None

Boolean indicating whether or not to vary parameter

**class** `matk.Observation` (*name*, *\*\*kwargs*)

MATK observation class

**name** None

Observation name

**residual** None

Observation value minus simulated value

**sim** None

Simulated value generated by MATK model

**value** None

Observation value

**weight** None

Weight to apply to simulated values

**class** `matk.SampleSet` (*name*, *samples*, *index\_start=1*, *\*\*kwargs*)

MATK samples class - Stores information related to a sample includeing parameter samples, associated responses, and sample indices

**corr** (*type='pearson'*, *plot=False*)

Calculate correlation coefficients of parameters and responses

**Parameters** **type** (*str*) – Type of correlation coefficient (pearson by default, spearman also available)

**Returns** `ndarray(float64)` – Correlation coefficients

**index\_start** None

Starting integer value for sample indices

**indices** None

Array of sample indices

**name** None

Sample set name

**obsnames** None

Array of observation names

**parnames** None

Array of parameter names

**responses** None

Ndarray of sample set responses, rows are samples, columns are responses associated with observations in order of MATKobject.obslist

**samples** None

Ndarray of parameter samples, rows are samples, columns are parameters in order of MATKobject.parlist

## INDICES AND TABLES

- *genindex*
- *modindex*
- *search*

**m**

matk, 1

## A

add\_obs() (matk.matk method), 1  
 add\_par() (matk.matk method), 1  
 add\_sampleset() (matk.matk method), 1

## C

calib\_value (matk.Parameter attribute), 4  
 calibrate() (matk.matk method), 1  
 corr() (matk.SampleSet method), 5

## D

dist (matk.Parameter attribute), 4  
 dist\_pars (matk.Parameter attribute), 4

## E

expr (matk.Parameter attribute), 4

## F

forward() (matk.matk method), 1

## I

index\_start (matk.SampleSet attribute), 5  
 indices (matk.SampleSet attribute), 5

## J

J() (matk.matk method), 1  
 Jac() (matk.matk method), 1

## M

make\_workdir() (matk.matk method), 2  
 matk (class in matk), 1  
 matk (module), 1  
 max (matk.Parameter attribute), 4  
 mean (matk.Parameter attribute), 4  
 min (matk.Parameter attribute), 4  
 model (matk.matk attribute), 2  
 model\_args (matk.matk attribute), 2  
 model\_kwargs (matk.matk attribute), 2

## N

name (matk.Observation attribute), 5

name (matk.Parameter attribute), 5  
 name (matk.SampleSet attribute), 5  
 ncpus (matk.matk attribute), 2  
 nvals (matk.Parameter attribute), 5

## O

obs\_names (matk.matk attribute), 2  
 obs\_values (matk.matk attribute), 2  
 obs\_weights (matk.matk attribute), 2  
 Observation (class in matk), 5  
 obsnames (matk.SampleSet attribute), 5  
 offset (matk.Parameter attribute), 5

## P

par\_dist\_pars (matk.matk attribute), 2  
 par\_dists (matk.matk attribute), 2  
 par\_maxs (matk.matk attribute), 2  
 par\_mins (matk.matk attribute), 2  
 par\_names (matk.matk attribute), 2  
 par\_nvals (matk.matk attribute), 2  
 par\_values (matk.matk attribute), 2  
 Parameter (class in matk), 4  
 parameters\_file (matk.matk attribute), 2  
 parnames (matk.SampleSet attribute), 6

## R
